INTRODUCTION

Use of symbols

The symbols used in this manual refer to the following:

WARNING

The following text contains instructions aimed at preventing bodily injury or direct damage to the crops, the product and/or the infrastructure.

CAUTION

The following text contains instructions aimed at preventing unwanted system operation, installation or conditions that, if not followed, might void the warranty.

ATTENTION

The following text contains instructions aimed at enhancing the effective use of the instructions in the manual.

NOTE

The following text contains instructions aimed at emphasizing certain aspects of the installation or operation of the product.

SAFETY FOOTWEAR

The following text contains instructions aimed at preventing foot injury.

TIP

The following text provides clarification, tips or useful information.

Aim of this manual

The aim of this manual is to guide the user in setting up, installation, operation and maintenance of the MegaNet™ sprinkler in its various applications.

Safety instructions

- All applicable safety instructions and regulations must be observed and applied.
- The effectiveness of the equipment may be jeopardized or impaired if the equipment is used in a manner other than that specified by the manufacturer.

WARNING

In an agricultural environment - always wear protective footwear.

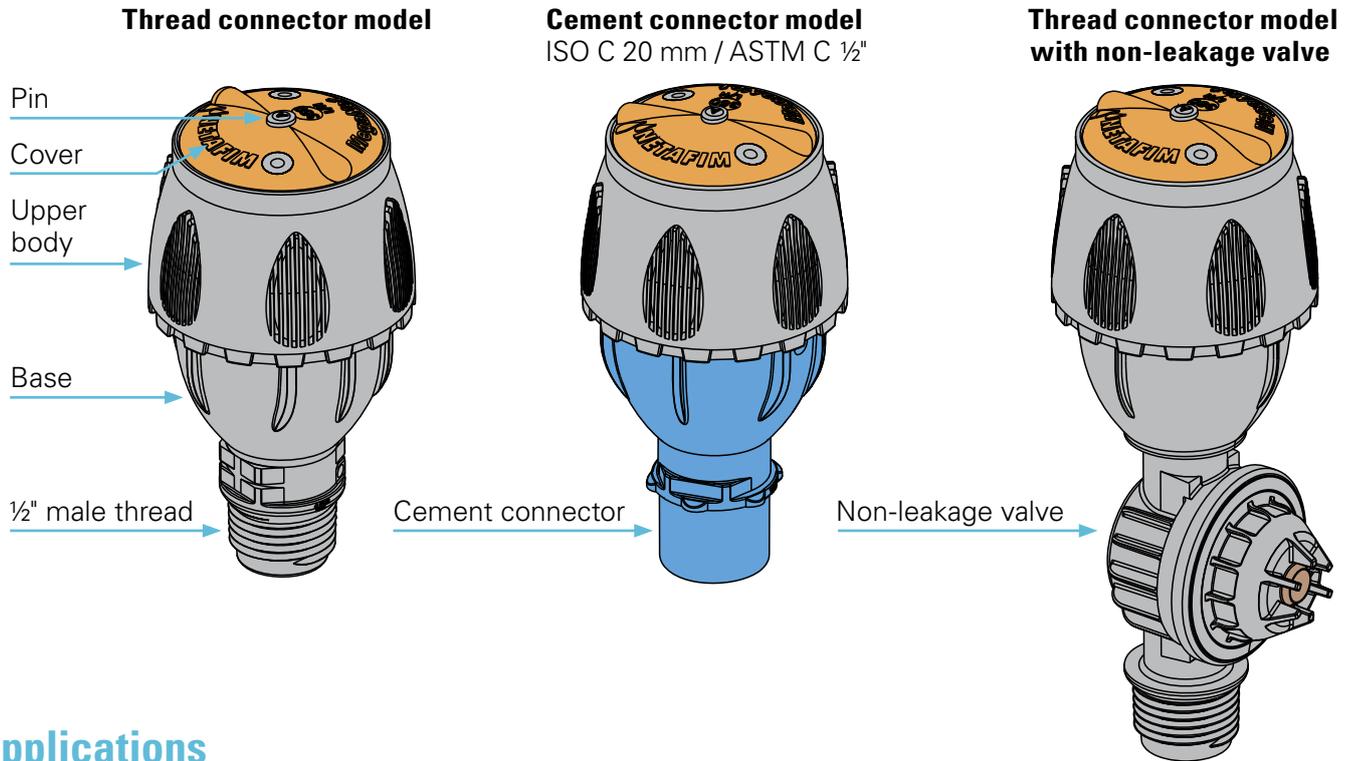

CAUTION

When opening or closing any manual valve, always do so gradually, to prevent damage to the system by water hammer.

MEGANET™ ROTATING IMPACT SPRINKLER

Description

Applications

- For under-tree irrigation and shade/net houses.
- For vegetables and open field crops, open field nurseries, crops germination, frost mitigation, cooling fruit orchards and roof dust cleaning.

Benefits and features

Ensures high and uniform yield

- The MegaNet™ has symmetric structure that allows the water split to two equal water jets, that contribute to a balanced sprinkler, providing very high water distribution uniformity.

Increased germination percentage

- Thanks to the gentle water jet, and relatively small drops near the ground, the MegaNet™ does not groove the soil along the whole irrigation event (including startup and shut off), which prevents from the seed to be exposed out of the soil.

Reduced maintenance cost

- The MegaNet™ has a popup mechanism and it opened only during irrigation, this mechanism protects the nozzle and protect the sprinkler's moving parts, by preventing insects and dirt particles to get inside the sprinkler.
- Each MegaNet™ sprinkler has an integral filter that ensures clean water inside the nozzle. In addition, this filter can be easily cleaned if needed.
- Extended product life achieved by superior raw material composition resistant the chemicals, fertilizers, and sun exposure.

MEGANET™ ROTATING IMPACT SPRINKLER

Specifications

- 7 different nominal flow rates: 200, 250, 350, 450, 550, 650, 750 l/h.
Nominal flow rates at 2.3 bar pressure.
- Recommended working pressure: 2.0 to 3.0 bar (at the sprinkler head).
- Recommended filtration: 400 micron / 40 mesh.

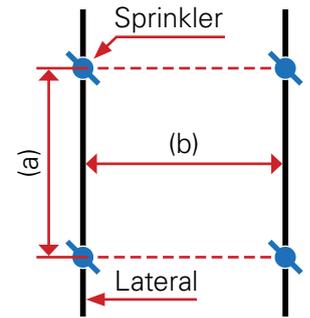

ATTENTION

Filtration method is to be selected based on the kind and concentration of the dirt particles existing in the water.

- Wherever sand exceeding 2 ppm exists in the water, a Hydrocyclone is to be installed before the main filter.
- When sand/ silt/ clay solids exceed 100 ppm, pre treatment will be applied according to Netafim™ expert team's instructions.
- Can be installed on solid sets or in removable field stands.
- Made of UV-protected materials, durable to all climate conditions and nutrients injected in agricultural applications.
- Water trajectory: 15 degrees
- Inlet connector:
 - 1/2" Threaded inlet connector
 - 20 MM ISO inlet connector (to be glued to PVC)
 - 1/2" ASTM inlet connector (to be glued to PVC)
- Code colored locking pins and caps for easy identification.
- 2 balanced water jets.
- Individual filter in each sprinkler.
- MegaNet™ sprinklers meet ISO 8026 standards (SI 1406) with production certified by the Israel Standards Institute (SII).

------------	-------	-----------------	-----------------	-------

**Do not confound isosceles with equilateral:

- An isosceles triangle is a triangle in which two sides are of equal length. The distance between 2 adjacent sprinklers on the same lateral (a) is not equal to the distance between 2 sprinklers on adjacent laterals. The height of the triangle represents the distance between adjacent laterals (b). Isosceles is usually referred to in open-field applications.
- An equilateral triangle is a triangle in which all three sides are equal. The distance between 2 adjacent sprinklers on the same lateral is equal to the distance between 2 sprinklers on adjacent laterals. Equilateral is occasionally referred to in orchards due to the tree planting pattern.

*Nominal flow rate at 2.3 bar working pressure.

TECHNICAL DATA

Sprinkler water trajectory

A. Distance - Distance of max. trajectory height from sprinkler nozzle.

B. height - Elevation of max. trajectory height above ground.

Trajectory height above sprinkler nozzle

The maximum trajectory height above the sprinkler nozzle is relevant in the following cases:

- When sprinklers are used under the canopy to prevent wetting the foliage.
- When sprinklers are used in a net-house or inside a roofed structure such as a glasshouse, to prevent wetting the net or the ceiling.

INSTALLATION

Introduction

CAUTION

Assembly must be done gently. Do not overtighten or use excessive force.

Tools required

- 20 mm spanner
- 30 mm spanner

Various installation configurations

Netafim™ sprinklers can be installed at a convenient height in different configurations, to suit the needs of various crops and field conditions.

Among the various installation options:

- **Mega Stand™** - a ½" diameter robust and durable modular sprinkler stand suitable for a variety of agriculture and mining irrigation applications.
- **IMP SPR stand™** - a ½" diameter stand, satisfactorily used by farmers all over the globe for many years. It became a classic in open field and orchard irrigation due to its durability, simplicity and versatility. It can accommodate any type of ½" sprinkler.
- **Solid set** - Netafim™ offers a comprehensive range of sockets and reducer couplings dedicated to the proper connection of sprinklers to solid-set riser pipes (PVC or other rigid pipes). Usage of these accessories ensures appropriate, safe operation and longevity of the sprinklers.

See the installation manual for each one of the above installation options at

<http://www.netafim.com/irrigation-products-technical-materials>

MAINTENANCE

To assure proper operation of the sprinkler, a simple inspection and maintenance procedure should be carried out regularly.

Rinsing the filter

- Frequency:** Before the beginning of each growing season or in case one of the following symptoms occurs:
- The sprinkler doesn't emit water.
 - The flow of water emitted is low.

Action:

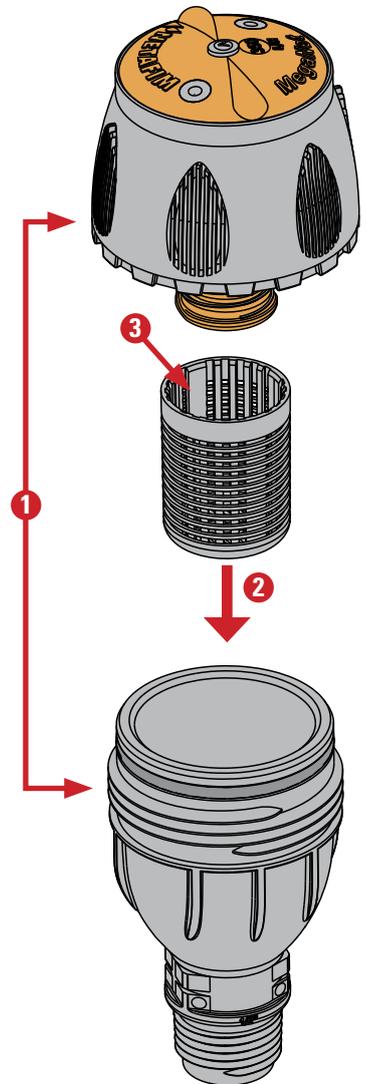

1. Open the sprinkler by unscrewing the upper body of the sprinkler from its base.
2. Detach the filter by pulling it down.
3. Clean the filter from the inside with a water jet or pressurized air.
4. Put the filter back in place.

CAUTION

Never operate the sprinkler without the filter. Failure to comply with this instruction will clog the sprinkler, and may damage it and void the warranty.

5. Reassemble the sprinkler.

MAINTENANCE

Checking the turbine and the cover

Frequency: Before the beginning of each growing season

Action:

1. Open the sprinkler by unscrewing the upper body of the sprinkler from its base.
2. Detach the filter by pulling it down.
3. Remove the pin by pulling it up with your fingernail or with a small screwdriver.

CAUTION

Be sure not to lose the pin. It is essential to the operation of the sprinkler. Aside from indicating the sprinkler trajectory angle it also serves to hold the cover and the turbine in place.

4. Push the sprinkler's top mechanism up and hold it.
5. Remove the colored cover by pulling it up.
6. Remove the turbine by pulling it up.
7. Visually check the 2 black tabs on the underside of the colored cover for wear.
8. Visually check the tab on the top side of the turbine for wear.

If any of them is worn, replace both parts - the cover and the turbine.

9. Put the filter back in place.
10. Reassemble the sprinkler.

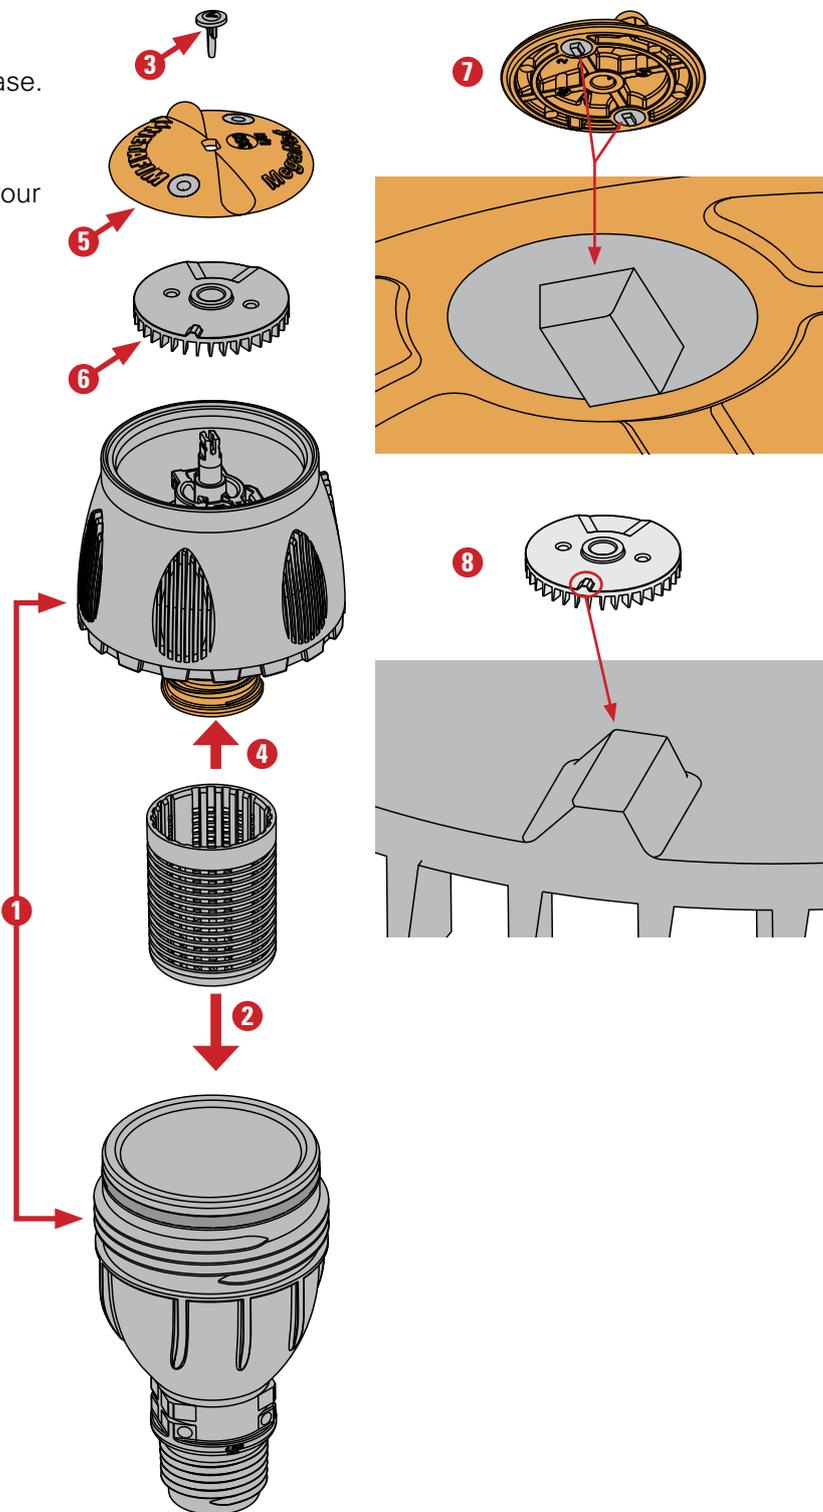

CAUTION

Do not forget to put the pin back in place. It is essential to the operation of the sprinkler.

NOTE

It is recommended to replace the cover and the turbine every 2000 irrigation hours.

MAINTENANCE

Cleaning the nozzle

CAUTION

Never operate the sprinkler without the filter.

Failure to comply with this instruction will clog the sprinkler, and may damage it and void the warranty.

If the above instruction is followed, the sprinkler nozzle should never get clogged.

In the event that the sprinkler has been operated without the filter in place, it is possible to clean the nozzle.

Follow the instructions below:

NOTE

The drawings below present the sprinkler's upper body without the pin, the colored cover and the turbine, to show the actions described. In practice, these 3 parts are connected to the top of the diverter throughout the dismantling and reassembling process, and do not interfere with it.

NOTE

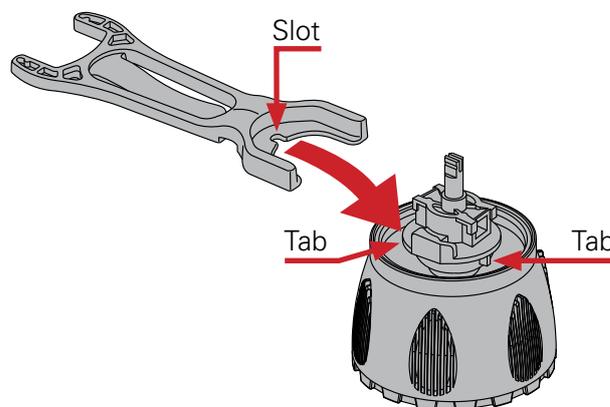

2 service keys are supplied with each box of MegaNet™ sprinklers. Additional service keys can be ordered separately (Cat. No. 63620-004500).

1. Open the sprinkler by unscrewing the upper body of the sprinkler from its base (see [page 21](#), step 1).
2. Push the sprinkler's top mechanism up and hold it (see [page 21](#), step 4).
3. Insert the slotted end of a service key underneath the diverter holder.

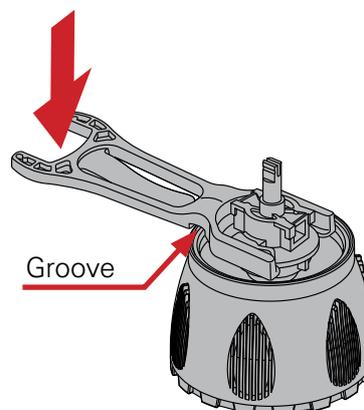

ATTENTION

There are 2 opposing tabs on the underside of the diverter holder. Make sure that the slot of the service key holds one of the tabs.

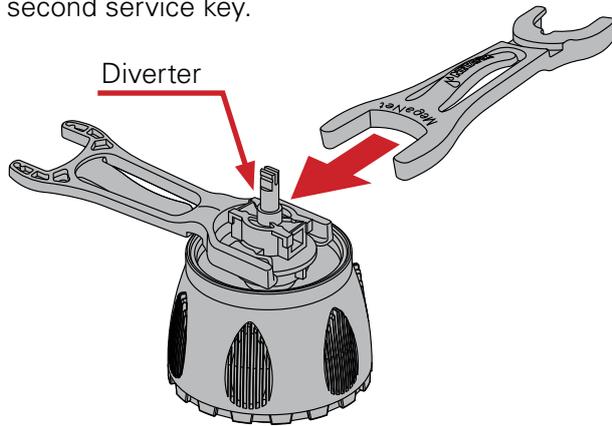

4. Push the far end of the service key down to the horizontal position with the groove underneath the key resting on the rim of the sprinkler's upper body. In this position, the service key should hold in place.

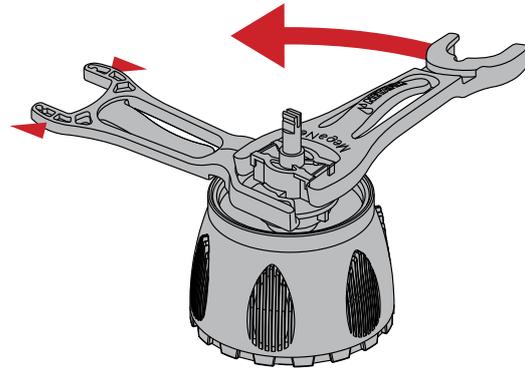

MAINTENANCE

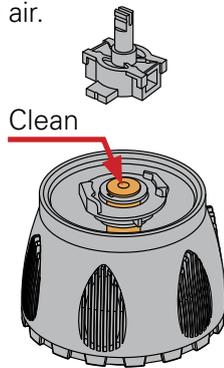

5. Release the diverter using the other end of the second service key.

Hold the first service key in place and turn the second service key counterclockwise to release the diverter.

6. Clean the nozzle from the top with a water jet or pressurized air.

7. To reassemble the sprinkler perform the steps above in reverse order. When putting the diverter back in place, turn the key clockwise until the diverter snaps in place. A click should be heard.

CAUTION

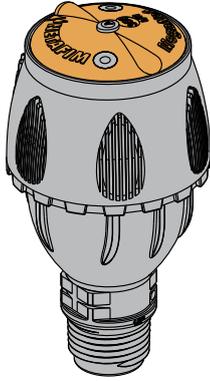

When reassembling the sprinkler, do not forget to put the filter in place to avoid clogging the nozzle in the future.

APPENDIX 1: SPECIAL APPLICATIONS

Special model for cement connection (blue base)

Can be cemented to the end of a PVC riser tube in solid set installations. Effective for theft prevention.

2 types are available:

- ISO C 20 mm
- ASTM C 1/2"

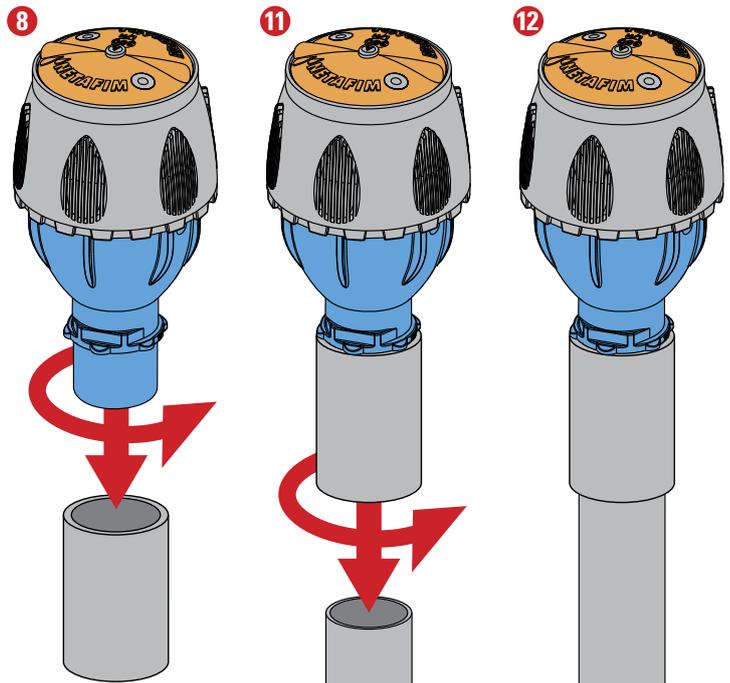

Cementing to a 1/2" (or 20 mm) PVC pipe

NOTE

Read and understand all the instructions before performing this procedure.

1. Use WELD-ON 717 PVC cement and P68 primer or their equivalents.
2. Trim the application brush to the desired shape.
3. Dip the application brush in the P68 primer. Squeeze the brush to remove excess solvent.
4. Using the brush, clean the inner surface of the socket with the primer.
5. Using the brush, clean the outer surface of the sprinkler housing with the primer.
6. Wait 60 seconds for the primer to dry before applying the cement and then neatly apply the cement to the outer surface of the sprinkler housing.
7. Apply the cement to the cylindrical part of the sprinkler housing below the circular rib.
8. Insert the sprinkler housing into the socket in a rotational motion (1/4 turn) to spread the cement over the entire surface. Make sure the sprinkler is fully inserted into the socket.
9. Hold the sprinkler and socket together for about 30 seconds to make sure they are firmly connected.
10. Remove any excess cement with a dry cloth.
11. Repeat all the steps above when cementing the socket to the riser tube.
12. Wait at least 6 hours for the cement to fully solidify before running water through the sprinkler.

APPENDIX 1: SPECIAL APPLICATIONS

Special model with anti-drain valve

For use in sloped fields in order to prevent drainage of the distribution pipe and possible over-saturation of the soil, unwanted puddles or landslide.

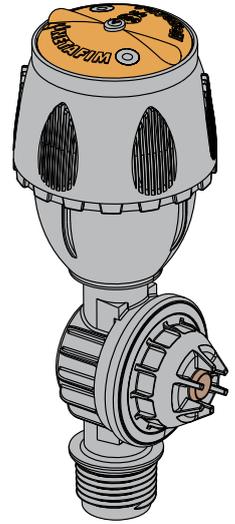

Features and benefits

- Automatic end-of-irrigation shut-off valve.
- Prevents water backflow or drainage of the system into low areas.
- Eliminates the need for system water refill at the beginning of the next irrigation cycle.
- Shut-off pressure: 0.6 bar

Installation

The installation process of this model is similar to that of the regular model (see [pages 10-19](#)).

Screwing and tightening of the sprinkler can be done by hand. The use of a 20 mm spanner is not necessary.

Adding a PRV (pressure regulating valve)

Install a PRV at the sprinkler inlet when a 100% flow rate and distribution uniformity is required.

The presented model is suitable for an exit pressure of 2.5 bar. For other exit pressure values, contact your local Netafim™ representative.

Installation

The installation process of the sprinkler and PRV is similar to that of installation on solid set riser pipes (see [page 12](#)).

Screwing and tightening of the PRV should be done by hand.

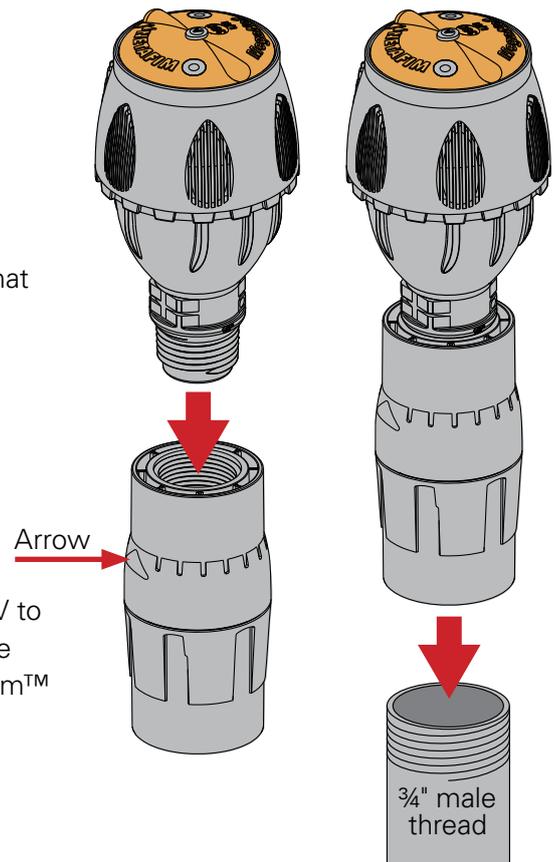

ATTENTION

Make sure the PRV is connected to the sprinkler with the arrow pointing towards the sprinkler (up).

NOTE

The PRV bottom thread is 3/4" female. To connect the PRV to a riser with a thread that is not 3/4" male, use an appropriate adapter/reducer from the vast selection offered by Netafim™ (see [page 26](#) and at [XXX](#)).

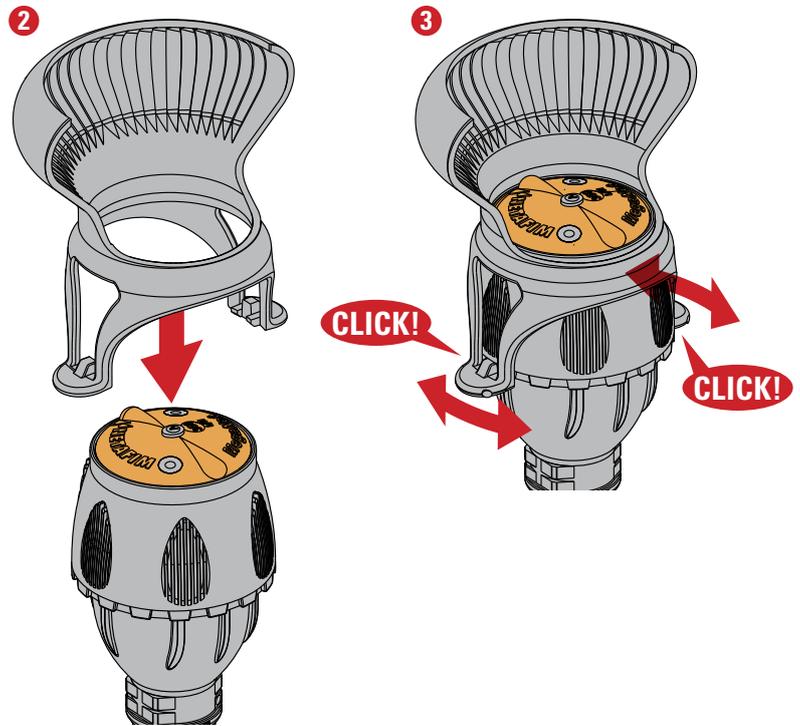

APPENDIX 1: SPECIAL APPLICATIONS

Road protector

To avoid wetting the roads around the field, Netafim™ offers a road protector to be used on the sprinklers at the boundaries of the field.

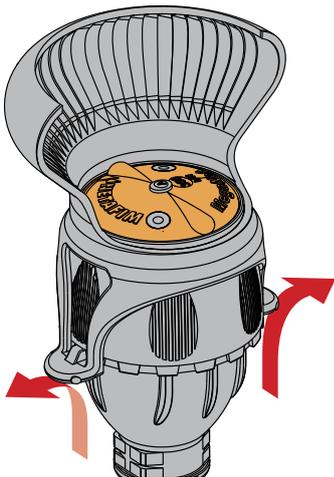

Installing the road protector

1. Place the road protector on top of the sprinkler with its back side facing the road you want to protect from water.
2. Push the road protector down onto the sprinkler head. Clicks should be heard.
3. Slightly rotate the road protector until more clicks are heard.

Removing the road protector

1. Push the 2 ears outwards and up to release the road protector from the sprinkler.

WARRANTY

Netafim™ warrants all the components of the MegaNet™ sprinkler to be free of substantial defects in material and workmanship for a period of 1 (one) year from the date of purchase.

If a defect is discovered during the applicable warranty period, Netafim™ will repair or replace, at its discretion, the product or the defective part.

This warranty does not extend to repairs or replacements of a MegaNet™ sprinkler or part resulting from misuse, negligence, alteration, force majeure, lightning, improper installation or improper maintenance, including any maltreatment of the MegaNet™ sprinkler or any part of the irrigation systems.

If a defect arises in your Netafim™ product during the warranty period, contact your Netafim™ supplier.

Limited warranty

This warranty is subject to the terms and conditions contained in Netafim's official warranty statement in force at the time of application.

For the full text of Netafim's official warranty statement, go to:

<http://www.netafim.com/irrigation-products-technical-materials>
